A lazy implementation

A recursively-constructed lazy sequence

Crunching
numbers with
Clojure

Daniel Solano
Gómez

Motivation

Finding primes

The Sieve

A lazy implementation

Improving
performance

Concluding
thoughts

```
(def prime-seq
  ((fn inner [p primes]
    (lazy-seq
      (cons p
              (inner (next-prime (inc p)
                                primes)
                    (conj primes p))))))
  2 []))
```

A lazy implementation

Finding the next prime

Crunching
numbers with
Clojure

Daniel Solano
Gómez

Motivation

Finding primes

The Sieve

A lazy implementation

Improving
performance

Concluding
thoughts

```
(defn next-prime
  [n primes]
  (if (has-prime-factor? n primes)
      (recur (inc n) primes)
      n))
```

A lazy implementation

Trial by division

Crunching
numbers with
Clojure

Daniel Solano
Gómez

Motivation

Finding primes

The Sieve

A lazy implementation

Improving
performance

Concluding
thoughts

```
(defn has-prime-factor?  
  [n primes]  
  (some #(divides? n %) primes))
```

A lazy implementation

The final piece

Crunching
numbers with
Clojure

Daniel Solano
Gómez

Motivation

Finding primes

The Sieve

A lazy implementation

Improving
performance

Concluding
thoughts

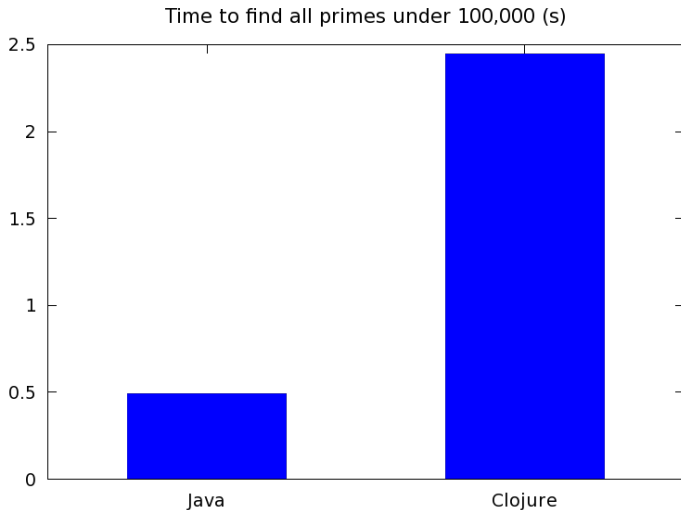

```
(defn divides?  
  [n d]  
  (zero? (rem n d)))
```

Performance

Clojure is nearly five times slower than Java

Assemble a performance
analysis toolkit:

1. Profiler
2. Disassembler

Profilers

Why use a profiler?

- ▶ Measure actual code execution to find true bottlenecks
- ▶ Avoid premature optimization

Profilers

Where to get one?

- ▶ Oracle's Java includes a simple profiler.

```
java -agentlib:hprof=help
```

- ▶ Other commercial and open source profilers available

Disassemblers

Why use a disassembler?

- ▶ Identify locations of primitive boxing and other compiler inefficiencies
- ▶ Allows you to intelligently add type hints or explicit method calls

Disassemblers

Where to get one?

- ▶ Most JDK includes a simple disassembler, javap. Use -c option to see disassembled code.
- ▶ Other commercial and open source disassembler available

Performance wish list
The tips

- ▶ Persistent collections with primitive interfaces
- ▶ 32-bit arithmetic support
- ▶ `*warn-on-boxing*` or `*disable-boxing*` compile-time flag

11 Clojure performance tips

1. Use primitive hints
2. Algorithms matter
3. Exploit known types
4. Choose the right data structure
5. Use unchecked arithmetic
6. Use the right division
7. Inline hot functions
8. Inline constants
9. Don't be lazy
10. Exploit the platform
11. Use your tools
